Afterword

In this volume, I have sought to describe the large-scale structure of the inductive inferences and the inductive relations of support in science. Although I am satisfied that the many chapters devoted to this task have made considerable progress in delineating that structure, I am sure that there is much more to be done. The research that led to this volume has been research in the history and philosophy of science. As I noted in the introduction, that research involves a continuing exchange between the philosophy of science and the history of science. One component of the exchange needs to be emphasized. I have found that a major source of theses in the philosophy of science lies in the study of the history of science. That history recounts the many examples of scientists who grappled with inductive problems of great difficulty and overcame them with inductive maneuvers of still greater ingenuity. Time spent studying the history is philosophically fertile in a way that armchair reflection is not. Armchair reflection can only return what each of us can think up ourselves. A study of the history of science can draw from the ingenuity of generations of the cleverest minds at their moments of greatest achievements. It provides an endlessly fertile repository of inductive ideas in the philosophy of science for those willing to explore it. This volume explores only a tiny portion of this repository. Much remains to be found. My hope is that this volume will encourage others to enter this repository and see what marvels they can find.

Index

Page numbers followed by f, t, and n denote figures, tables, and notes, respectively.

a priori propositions, Kantian synthetic, 92
 abduction, abductive inference, 35, 196, 211. *See also* inference to the best explanation
 “acceptance system,” notion of, 152
 Aczel, Peter, 113
 age, radiocarbon, 289–95
 Agricola, Georgius, 368, 369, 371, 376–77, 382
 Airy, George B., 342n12, 343f
 alkali and alkaline earth metals, spectra of, 275
Almagest (Ptolemy), 253, 348, 349
 alums, gallium, in Mitscherlich’s law of isomorphism, 311
 ammonia, Dalton’s formula, 301
 Ampère, hypothesis of, 307, 323
 ampliation, ampliative inference, 16, 20–21, 186; forms of, 16, 179, 195, 196; nondemonstrative, 195n9; notion of, 194–95; Salmon’s analysis, 183, 195n9, 214
 analogical inferences, 30–31, 32
 analogy(ies): arches, 66–69; architectural, 66; as argument form, 32, 139, 140; bare formal schema, 29, 31; to dome, 69; facts of, 32, 33; as form of inference, 30–31; material approach to, 31–32; reasoning by, 28; two-dimensional model, 30–31; vaulted ceilings, 69–72; to waves propagating, 140n14
 Andromeda nebula, 234, 236, 237, 244
 Anglo-Persian Oil Company, 378
 angular momentum, determining stable electron orbits, 282, 285
 Anti-Foundation Axiom, in set theory, 113
 aphelion of planets, in exactness of inverse square law of gravity, 265–66

apogee, perigee of objects in Ptolemaic astronomy (Moon, Sun, Mercury, Venus, Jupiter, Saturn) 350–51
 archaeological dating, 294. *See also* radiocarbon dating, mutually supporting evidence in
 arch(es), 66–69, 74–75; illustration, 67–69; for Moon test, 262f, 267f, 316f, 321f
 Archimedes, 337, 339
 Arditti, Fred D., 403–4
 Aristarchus of Samos, 335–39, 346
 Aristotle, 28, 105, 354
 Arnold, James R., 291, 294
 Aronson, David R., 405, 407
 Arp, Halton, 73, 130–33
 articulation model, of analogy, 31
 artifacts, dating of, 68, 103–4, 115. *See also* radiocarbon dating, mutually supporting evidence in
 astrology, 346n16, 366, 403
 astronomers, 12, 34, 36, 76, 109, 265; ancient, 331, 333, 341; Arp, 130–33; astrophysicists and, 130; Bahcall, 130–33; Curtis, 234; naked-eye methods, 339; Shapley, 234. *See also* Hubble, Edwin
 astronomy, 253n22, 332; anomalies, 34, 128; basic problem of, 331; Brahe’s, 42–43; curve-fitting problem, 263; geocentric, 348; Greek, 34, 332; heliocentric, 77, 332, 346, 353, 354, 358, 359; histories of, 345; introduction of telescopes to, 331; Kepler in, 346, 359; Simon Newcomb, leading authority in, 344; literature, 331–32; naked eye, 12, 76; observational and theoretical, 70; parallax in, 12, 76; physical, 62; Ptolemaic, 43, 164, 348; relative positions of Sun, Moon, and planets, 137. *See also* Copernican astronomy
 Atherino, Rodrigo, 405, 412
 atomic heat capacity, in Dulong and Petit’s law of specific heats, 309

- atomic spectra, mutually supporting evidence in: Bohr's theory of atom, 280–82; discovery of regularities in emission spectra, 271–75; overview, 269–71, 276–79; quantum theory, 282–86; Ritz's combination principle, 275–76, 279–80, 282–86. *See also* quantum theory; Ritz's combination principle
- atomic weights, determination of: Avogadro's hypothesis, 326–27; circularity and, 301–4, 306–11; Dalton's atomic theory, 299–301; Dulong and Petit's law, 308–10, 318–21; failed hypothesis of simplicity, 304–5; heat capacity, 309; kinetic theory of gases, 321–26; Mitscherlich's law of isomorphism, 310–11; mutual support of, 313–21; overview, 297–99; vaulted inductive structure, 311–13. *See also* Avogadro's hypothesis; circularities; Dulong and Petit, law of
- atom(s): Bohr's atomic theory, 11, 78, 270–71, 274, 275, 279n6, 280–82, 283, 284–85; nitrogen, 291, 300. *See also* Bohr's theory of atom; hydrogen; oxygen; quantum theory; Ritz's combination principle
- Avogadro, Amedeo. *See* Avogadro's hypothesis
- Avogadro's hypothesis, 12, 298, 311, 312–13, 315–17, 326–27; appeal of, 326; Cannizzaro and, 71, 299, 307–8, 311, 312, 313, 314, 315, 318–21, 323, 324, 326, 327; in chemistry and kinetic theory of gases, 321–26; circularity, breaking, 306–8; Dulong and Petit, law of, 68–69, 71, 77, 299, 312, 318–21, 326–27; by equipartition theorem, 299; hydrogen gas, 317; Maxwell on, 325; mutual support of, 318–26
- Axiom of Foundation, Zermelo-Fraenkel, 113
- Aymar, Jacques, 377
- azimuthal quantum number, 285
- “azote” (nitrogen), in Dalton's system, 300
- Bachelier, Louis, 393
- Bacon, Francis, 23, 182, 186, 195
- Bahcall, John, 130–33
- Balmer, J.J., 72, 82, 269, 272–73, 274, 276, 277–78, 282
- bare formal schema, for analogical inference, 29
- Barin-Gould, Sabine, 377
- barium chloride, same crystallographic structure as radium chloride, 24, 25, 27
- Barrett, William F., 368, 373, 374, 377, 381
- Bartha, Paul, 30, 31
- Barwise, Jon, 113
- Bassetti, W.H.C., 390, 391–92, 401, 402, 405
- Bayes, Thomas, 179, 185, 186
- Bayesian analysis: of coherentism, 164–70; failure of generality, 47–49; Laplace's analysis and, 46–47, 48–49; Laplace's rule of succession, 45–46; within material theory of induction, 51–52; principal goal of, 163–64; probabilities, inapplicable, 49–51; problem, 44–45
- Bayesian approach: for matching DNA samples, 44; subjective, 51n24
- Bayesian epistemology, 168
- Bayesian inverse approach, 187
- Bayesianism, 215
- Bayesian literature on coherentism, 144
- Bayesian philosophy of science, 168
- Bayesian probabilistic representations, 166
- Bayesian system, 140, 145
- Bayesian vindication of inference, 205
- Bayes' theorem, 2, 44; application of, 140, 164, 166; prior probabilities and, 2–3, 140
- Becker, Adam, 93
- beliefs, 16, 20, 160, 175, 183, 190, 213, 222, 368, 383; cognitively spontaneous, 154; for coherentism, 7, 144, 145–47, 151, 153, 154, 155, 159, 162, 163, 164–65; in dowsing, 377; epistemology of, 159, 171, 179–80, 198–200, 219, 220, 223; foundationalist conception, 146; inferential relations among, 150; justification for, 7, 153, 159, 161, 191, 200, 202, 203; “local” and “global” levels of justification, 147–48; propositions vs., 155–58; system of, 150, 164–65; web of, 3
- Bell, Eric Temple, 93n14
- benign circularity, examples of, 112, 113
- Berry, Arthur, 102, 341
- “big bang” hypothesis, big bang cosmology, 78, 129–30, 157
- Bird, Alexander, 218n18
- bismuth, melting point illustrates material theory, 222
- Bohr, Niels. *See* Bohr's theory of atom
- Bohr's theory of atom, 270–71, 279n6, 280–82; attribution of spectra to helium, 275; consequence of, 78; evidential support, 271; outcome of, 274; quantum theory, 11, 78, 270, 271, 282, 283, 285; Ritz's combination principle, 281, 282, 283, 284–85
- Bokulich, Alisa, 290
- Boltzmann's constant, 322
- Bondi, Hermann, 78
- BonJour, Laurence, 145, 146, 151, 159; beliefs vs. propositions, 155–56, 157, 158;

- coherence vs. inductive support, 150;
- coherentism, problems of, 160, 161–62;
- coherentism vs. foundationalism, 153;
- “doxastic presumption,” 157; “input objection”/“isolation objection,” 153;
- literature in epistemology of belief, 158;
- “local” and “global” levels of justification, 147–48
- Born, Max, 283
- Bovens, Luc, 145, 163
- Boyd, Nora, 73, 123
- Boyle, Robert, 300, 370, 371, 376
- Boys, Charles, 373
- Brackett, Frederick S., 72, 82, 272, 273, 277, 278, 286
- Bradley, F.H., 189

- inductive evidence, concept of, 199
- inductive generalization, 16; analogy as form of, 28; forms of, 34–35
- inductive inferences: applicable rules or schemas for, 204; background facts, 20; challenges for, 17–20; claims and arguments, 4–9; formal accounts of, 139–41; formal approaches to, 29; forms of, 34, 44; Harman's schema of, 196; Hume's critique of, 182–85; hypothetico-deductive approach to, 3; justification for, 178, 196, 215–16; literature on, 9; locality of, 21; local vs. distributed justifications of, 178; logic of, 175, 198–99; material character of, 162; in mathematics, 154; in mature science, 178; nature of, 136; overview, 16–17; in philosophical literature, 9–10; principal accounts of, 17; rules of, 175, 176, 214–15; schemas of, 22–23, 202, 205, 212; simplicity as surrogate, 39–40; treatment of, 189; universal calculus of, 2; warrant/warranting facts of, 6, 19–20, 21, 33, 50, 60, 74, 79, 162, 176, 177, 178, 204, 218, 408
- inductive instability. *See* dowsing, instabilities of evidential competition
- inductive logics, 175, 198–99, 219–20; diverging, 382–83. *See also* domain-specific inductive logics, uniqueness of
- inductive logics, competition: competition among systems, 399–407; efficient market hypothesis, 394–95; fundamental analysis, 389–90, 400–401; Mandelbrot's fractals, 395–98; overview, 387–99; random walkers and fractals converge, 398–99; random walks, 392–94, 405–7; technical analysis (“chartists”), 390–92, 402–5
- inductively self-supporting structures: closure, 88–90; mature sciences, 90–91
- inductive relations of support, hypotheses in discovery of: discovery problem, 73–75; hypotheses, illustrations of, 75–78; hypothetico-deductive confirmation, 78–79
- inductive rigidity, of mature science, 83–86, 91
- inductive structure of atomic weights and molecular formulae, vaulted, 311–13
- inductive structures, deductive inferences in: feature of, 79–81; locally deductive but globally inductive, support, 81–83
- inductive support: natural hierarchical structure for, 232; regresses of, 208, 209, 218; strengths of, 168
- inductive support, nonempirical components: ineffable conditions, 94; Kantian synthetic, priori proposition, 92; mathematical structure, 92–94; principle of causality, 92; universal logic of induction, 91

- inductive support, nonhierarchical relations of: arch, 66–69; firm ground of experience, 72–73; hierarchical conception, tower, 62–63; hierarchy of generalizations, 65–66; lack of respect, 64–65; vaulted ceilings, 69–72
- inductive support, relations of, 136, 141; coherence vs., 150–53; determinate circularities, 114–15; differences of, 149; entangled relations of, 81–83; indeterminate circularities, 108–10; large-scale structure of material relations, 143, 144, 146, 147, 148–49; for mature science, 104, 177, 206, 210; single, global property of, 162; strength of, 150; uniqueness of, 119, 120, 121
- ineffable non-empirical conditions, 94
- inertial motion, 32, 137–38, 259
- inference(s): abductive, 196; ampliative, notion of, 16, 194–95, 195n9, 196; direct, 223; logical notion of, 16–17; nondemonstrative, 194–95; rule of, 211–12; summarized, 260–63
- inference to the best explanation, 35, 40, 73, 125, 140, 151, 175, 182, 196, 205, 225. *See also* abductive inference.
- Inference to Worst Explanation (IWE), 211–12
- “infinite regression,” concept of, 197
- “input objection,” to coherentist epistemology, 153
- instability(ies): Arp and Bahcall on origin of galactic red shifts, 130–33; big bang and steady state cosmology, 129–30; of competing systems, 407–11; Einstein and anomalous motion of Mercury, 127–28; illustrations of, 125–33; Lyell’s *Principles of Geology*, 126; more illustrations, 133; *Origin of Species* (Darwin), 125–26; Thomson’s cathode rays, 127. *See also* dowsing, instabilities of evidential competition; inductive logics, competition
- An Introductory Logic* (Creighton), 187
- intuitive principle of abstraction, in set theory, 102n1
- inverse probabilities, Bayes’ work on, 185, 186
- inverse square law of gravity, Newton’s, 10, 64, 257, 259; adjustment to exponent in, 128; Cavendish-type experiments, 69n2; celestial and terrestrial forces, 67–68, 260, 261, 262, 263; elliptical orbits and, 257, 263–65, 267f, 284n9; exactness of, 82, 265–67; Kepler’s third law, 284n9, 332–33, 360; propositions of, 257; universal gravitation and, 81

A must read for anyone who wonders about what makes science rational.

—HANS HALVORSON, Stuart Professor of Philosophy, Princeton University

Will be an essential touchstone for all future work on the logic of scientific reasoning.

—MARC LANGE, Theda Perdue Distinguished Professor of Philosophy,
University of North Carolina at Chapel Hill

The Large-Scale Structure of Inductive Inference investigates the relations of inductive support among the totality of facts comprising a science or science in general. These relations form a massively entangled, nonhierarchical structure, discovered by making hypotheses provisionally that are later supported by further inductive inferences. The result is a benignly circular, self-supporting inductive structure in which the classical Humean problem of induction cannot be formulated and analogous regress arguments fail.

The earlier volume, *The Material Theory of Induction*, proposed that individual inductive inferences are warranted not by universal rules but by facts particular to each context. This book now investigates how the totality of these inductive inferences interact in a mature science. Each fact that warrants an individual inductive inference is in turn supported inductively by other facts. Numerous case studies in the history of science support, and illustrate further, those claims. This is a novel, thoroughly researched, and sustained remedy to the enduring failures of formal approaches to inductive inference.

JOHN D. NORTON is a distinguished professor of history and philosophy of science at the University of Pittsburgh. He works in history and philosophy of physics and general philosophy of science.
